

KEY OBSERVATIONS SUMMARY

1. Sales Performance:

Total revenue hit \$1.26M from 1,200 orders, with an average order of \$1,054. Revenue peaked in April at \$170.6k, followed by a sharp decline from May to August, suggesting seasonality or an operational issue.

2. Product & Channel Drivers:

Tablets and Printers were the top revenue products at ~\$195k each. On the acquisition side, Instagram and Referral were the strongest channels, bringing in \$275k and \$226k respectively outperforming paid and email channels.

3. Operational Risks:

The order status breakdown shows 247 Returns vs 237 Shipped Orders, putting the return rate at ~20%. That's high and likely impacting profit margins and customer satisfaction. Payment methods are well balanced, with no single method dominating.

RECOMMENDATIONS

1. Investigate the return rate ASAP

The return rate is at 20% which is high and above standard. Pull the top returned SKUs and reasons. If it's quality/defects, talk to suppliers. If it's description mismatch, update product pages and photos.

2. Double down on Instagram & Referral

Those channels brought in \$501k combined, more than Email, Facebook, and Google. Test increasing budget there, and run a referral incentive to push it further.

3. Diagnose the May-August revenue dip

Check if it was stock outs, price changes, pause ads, or seasonality. If it's seasonal, plan campaigns or promos for that window next year so you don't get the same drop.

These give you a clear next step for ops, marketing, and planning.
